The good or bad quality of our life is depending on the quality of our natural environment. Our need for food, water, shelter, and other amenities depends on the environment around us. There must be a balanced natural cycle that exists between the environment and life in its surroundings.

Human society is playing a vital role in degenerating the natural environment, which is affecting badly the lives on this planet. All the human actions in this modern world has direct impact our ecosystem. Many actions of humans have brought big changes to our planet, resulting in many environmental problems. Increasing demand for environment friendly technologies and industries is another important factor.

Environmental Issues

There are many harmful effects of human activities on the environment. Some of these are pollution, over-population, waste disposal, climate change, global warming, and the greenhouse effect and so on... The big reason that poses a serious threat to our environment is the

harmful gases in the air. The uncontrolled use of automobiles has increased their effects, which in turn emits harmful gases like carbon dioxide and carbon monoxide. The electronic appliances like air conditioners and refrigerators also contaminating the air by the discharge of harmful emissions. The diverse effect of these gases is causing air pollution as well as global warming.

Deforestation is another major reason of environmental degradation. The human population is increasing at an alarming and therefore to meet their daily consumption we need to cut forests and trees. It may be for house construction or for fuel, but we are causing great loss to the environment. Other factors are the depletion of natural resources like water, fuel, and food. Over consumption of resources by humans and improper waste disposal has resulted in a huge quantity of solid and hazardous wastes generation. All these wastes are threats to life in our environment.

Solutions of the Problems

Due to all the above human activities, our planet

has reached unsustainable levels. Therefore, it is our duty and responsibility to lower the loss and play a significant role in bringing out solutions. For example, we should take a pledge to say 'No' to plastics. Instead of it, we may make use of eco-friendly substitutes like paper and cloth bags. The government of every country must implement strict laws for industries those are releasing the toxic wastes for proper waste management. The awareness programs should be organized to encourage citizens to use public transport as much as possible. Reducing the use

of vehicles will decrease the emission of harmful gases as well we can save the fuel resources. To conclude, saving the environment is the need of the hour and we have to spread this awareness to our society beginning from our own home. As a responsible citizen each one of us should pledge to work together towards a greener and more sustainable environment we inherit.
